Layout of Linac with NC and SC Modules

● 402.5 MHz, 2.5 MW klystron
○ 805 MHz, 5 MW klystron
◌ 805 MHz, 0.55 MW klystron

SNS Linac Contains 4 Linac Sections

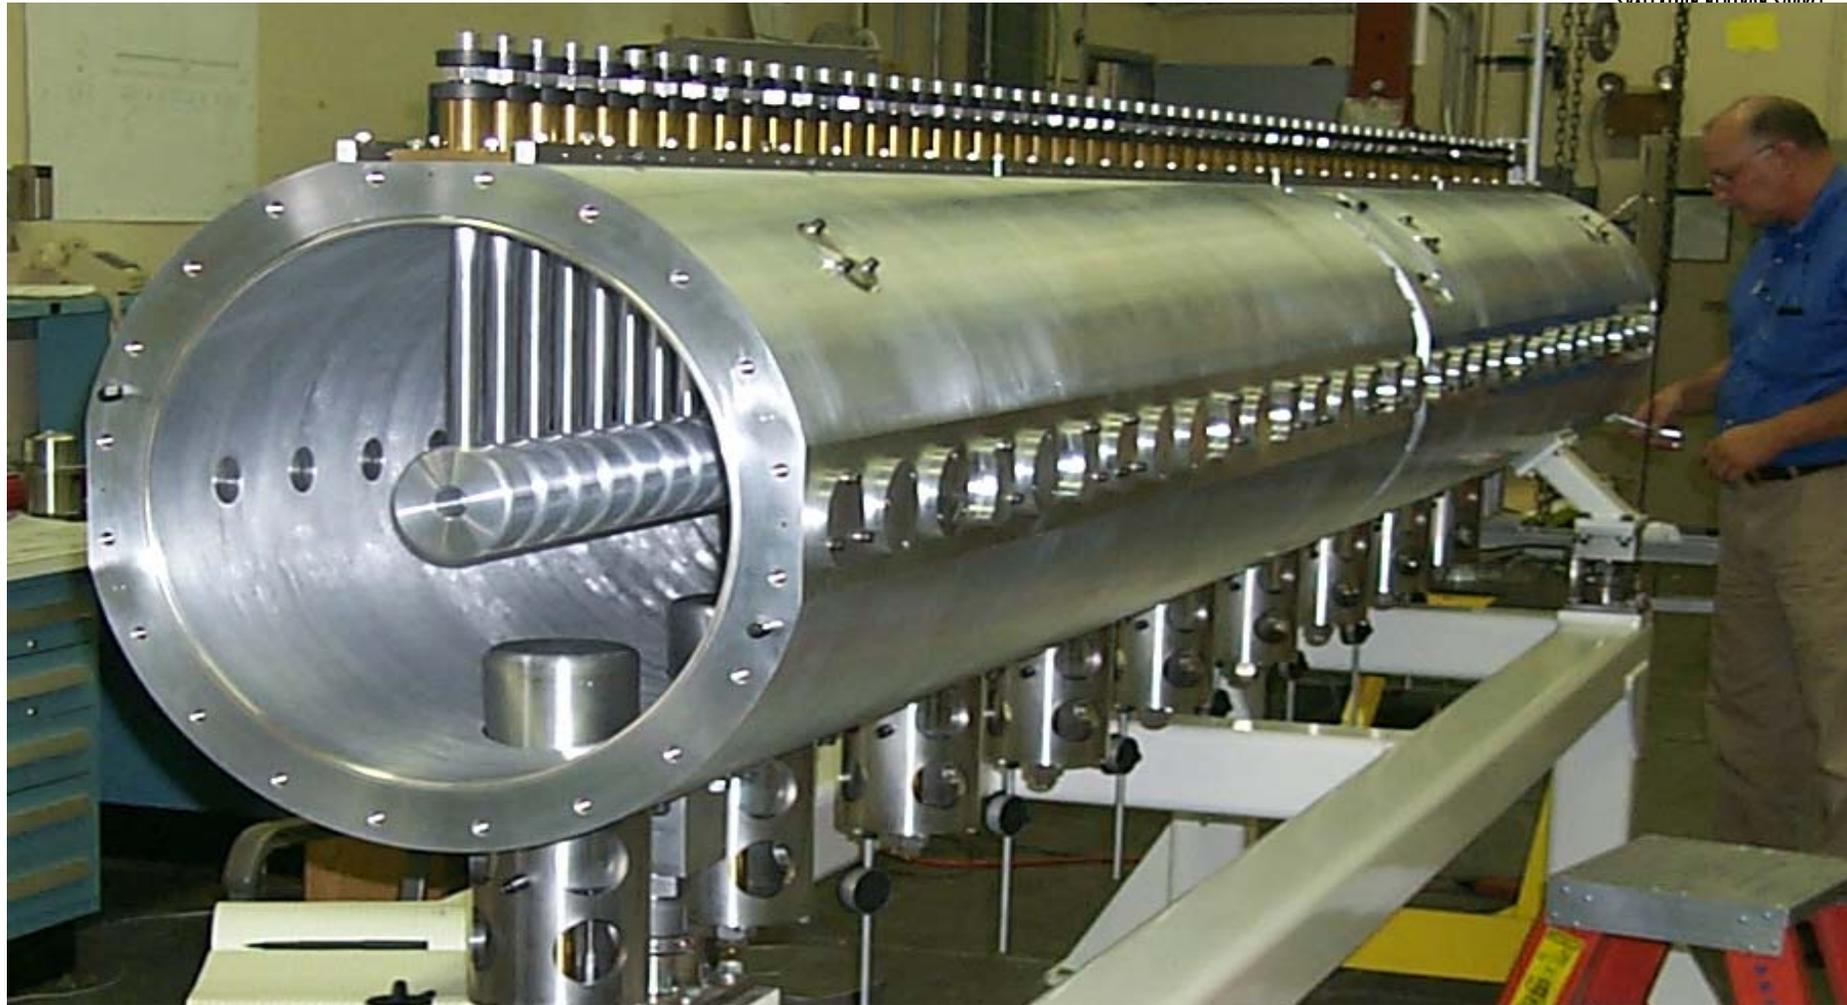

Structure	W_{final}	Total Length	Cells per Cavity	Cavities per Module	Modules	No of Klystrons	Klystron Power
	MeV	m					MW
DTL	87	37	60 to 21	-	6	6	2.5
CCL	186	92	8	12	4	4	5.0
SRF I	394	158	6	3	11	33	0.55
SRF II	1000	251	6	4	12	48	0.55

Design Requirements & Constraints

Parameter	Value
W_{initial}	2.5 MeV
W_{final}	1 GeV
I_{ave}	1.56 mA
$W_{\text{final stability}}$	± 1.5 MeV
$W_{\text{final spread}}$	± 0.33 MeV rms
$\varepsilon_{\text{initial, rms, norm}}$	$\approx 0.27 \pi$ mm-mrad
$\varepsilon_{\text{final, rms, norm}}$	$\leq 0.5 \pi$ mm-mrad
Beam loss	≤ 1 W/m throughout
Beam duty factor	6 %
Chopper duty	68 %
SRF cavities	33 ea $\beta = .61$, 48 ea $\beta = .81$

Tank 1 Cold Model Verified Stabilization Scheme

Missing Gaps are Compensated by Adjusting ϕ_s in Adjacent Gaps

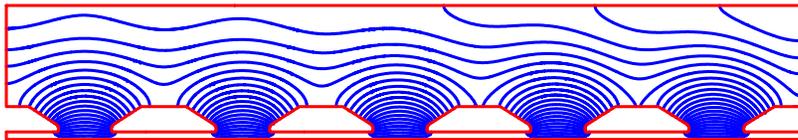

- $1-\beta\lambda$ gaps between tanks represent
 - A missing longitudinal focusing gap &
 - A missing rf defocusing lens
- ϕ_s adjustments in 6 adjacent cells compensate the missing elements
 - Corrects both longitudinal focusing and transverse rf defocusing.
- E_0 increased by $\sim 1\%$ to make up for the lost acceleration.
 - Tank lengths change a few mm.
 - Drift-tube dimensions change only slightly.

Cell Length Adjustment Does Not Detune the Tank

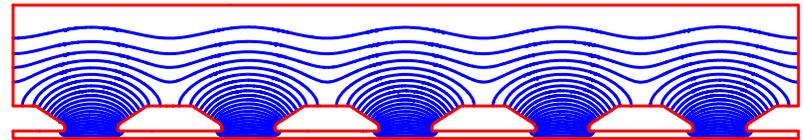

- Previous methods for shifting ϕ_s moved the gap within a 360° cell resulting in an asymmetry that severely detuned the cell, which causes field tilts if not corrected.
- Present method uses cells a few degrees shorter or longer than 360° to shift the phase.
 - Cells remain very nearly symmetric.
 - Resonant frequency is unchanged.
- With tuned cells, field flatness and frequency are guaranteed as confirmed by multicell SUPERFISH calculations.

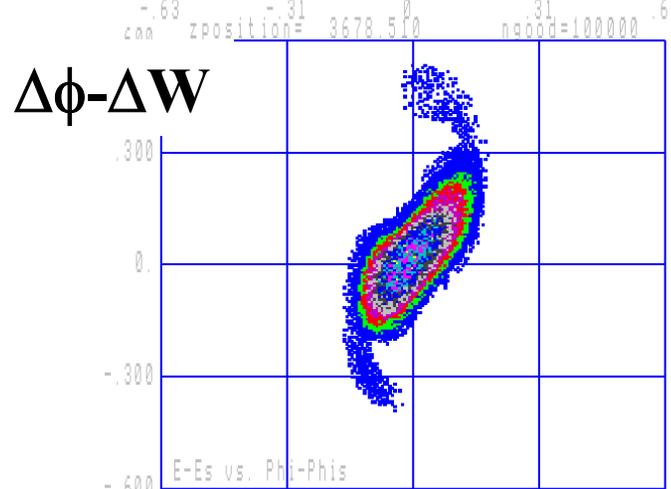

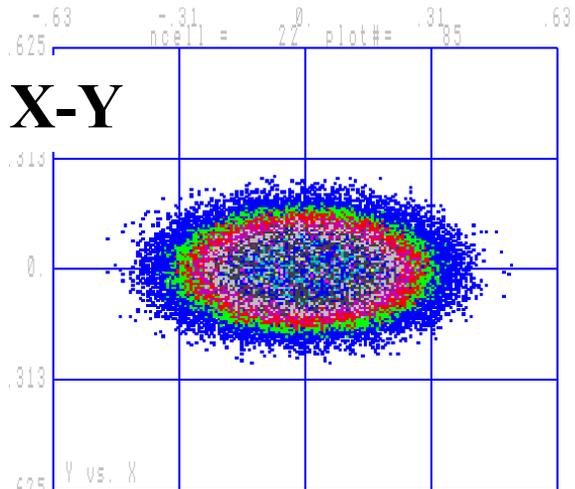

Shifted gaps within cell, 402.1 MHz

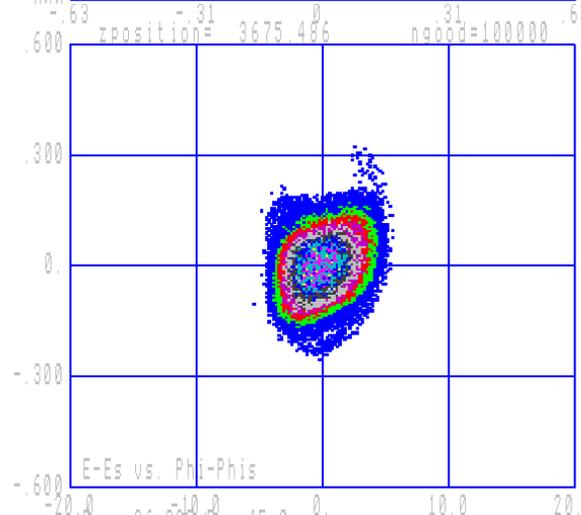

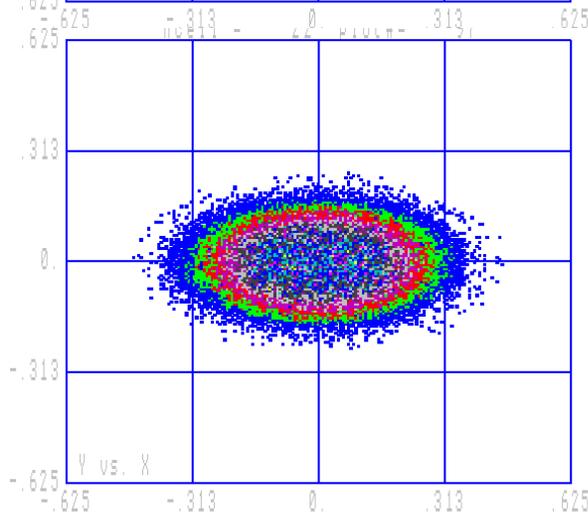

Shorter cells, 402.5 MHz

Projections of the Beam Distribution Show Improvement at DTL Exit

DTL

Effect of Inter-Tank Matching is Reflected in Radial Distribution at 1 GeV

Particle Distribution at the End of Linac

A CCL Hot Model will Verify the Engineering Design & Tuning Plan

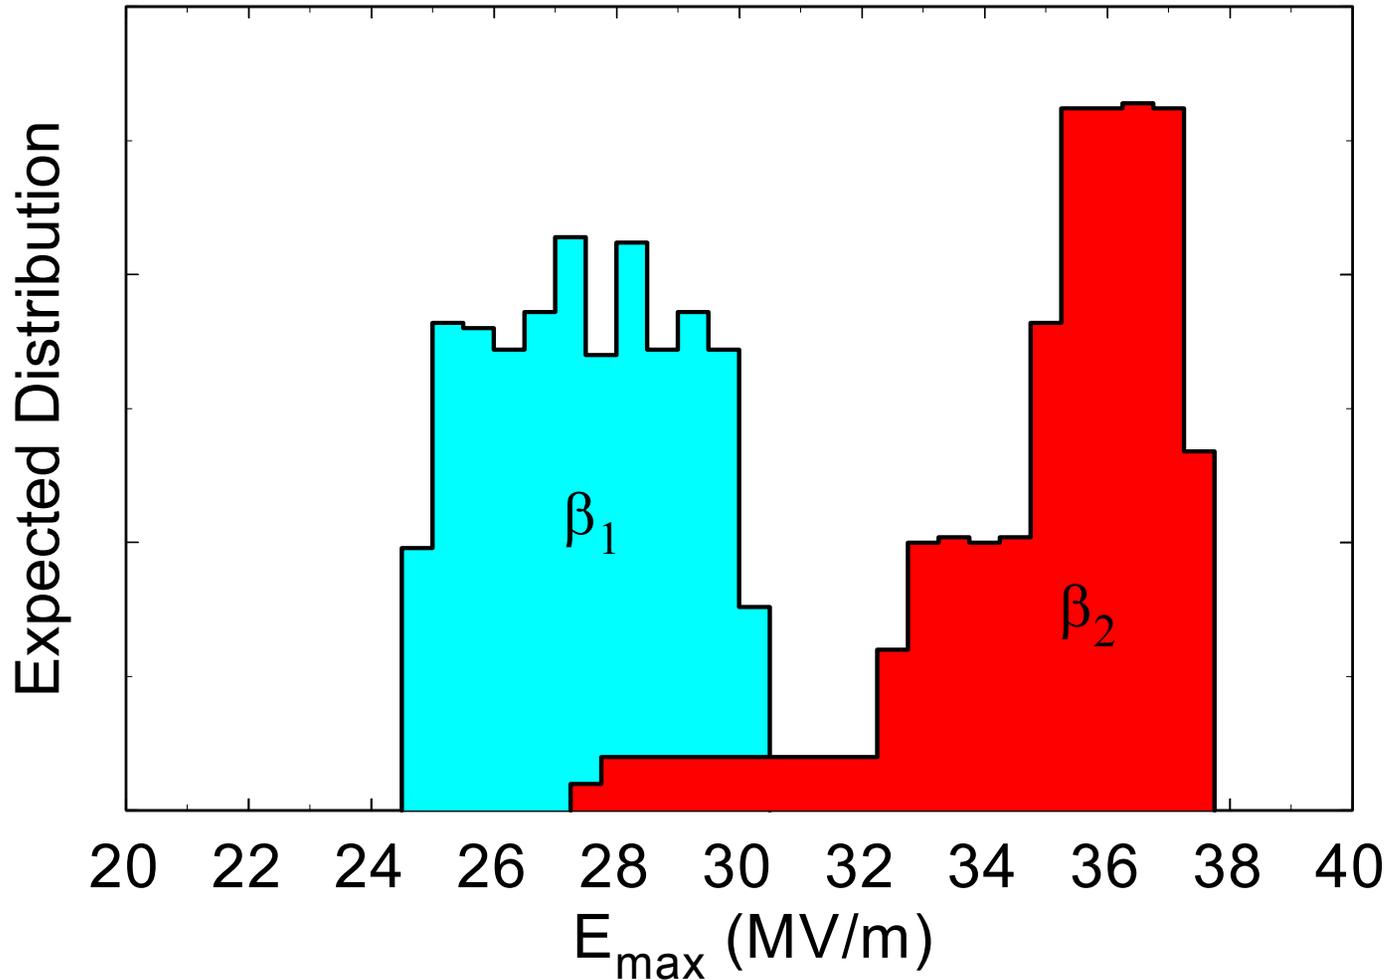

33 $\beta=0.61$ Cavities Accelerate the Beam from $\beta=0.55$ to 0.70

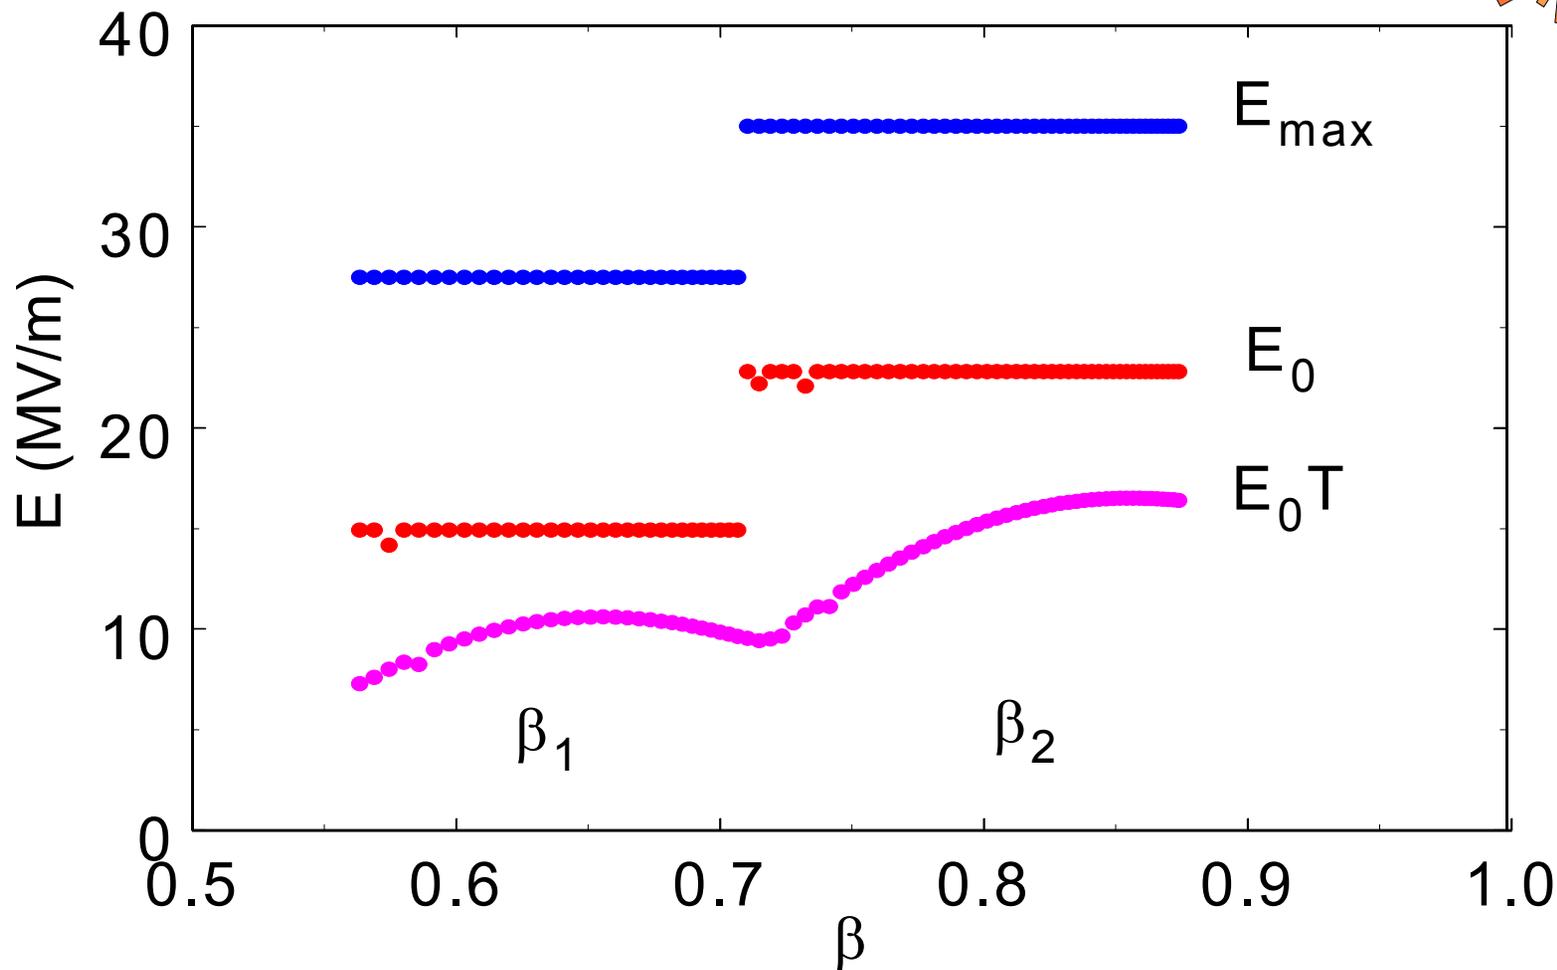

48 $\beta=0.81$ Cavities Accelerate the Beam from $\beta=0.70$ to 0.87

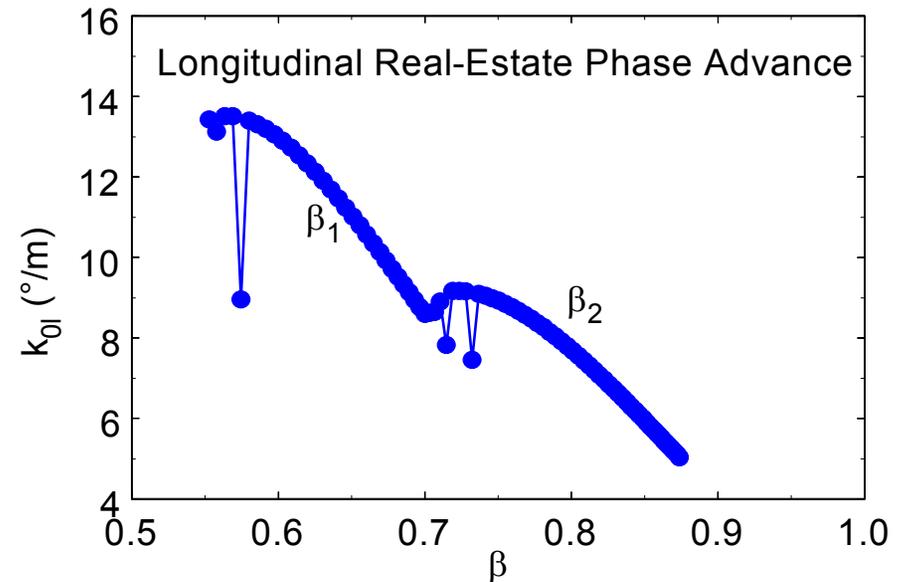

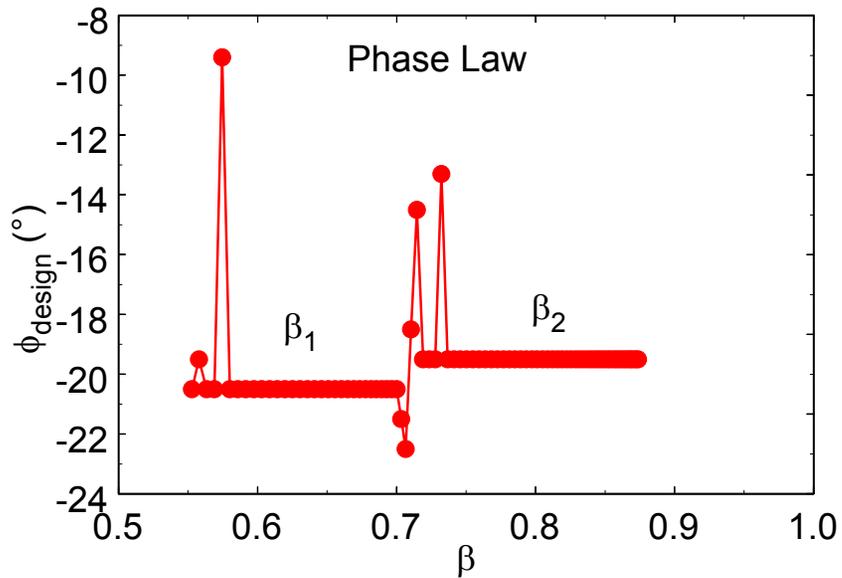

SRF Linac Performance will Depend on Success of Cavity R&D Program

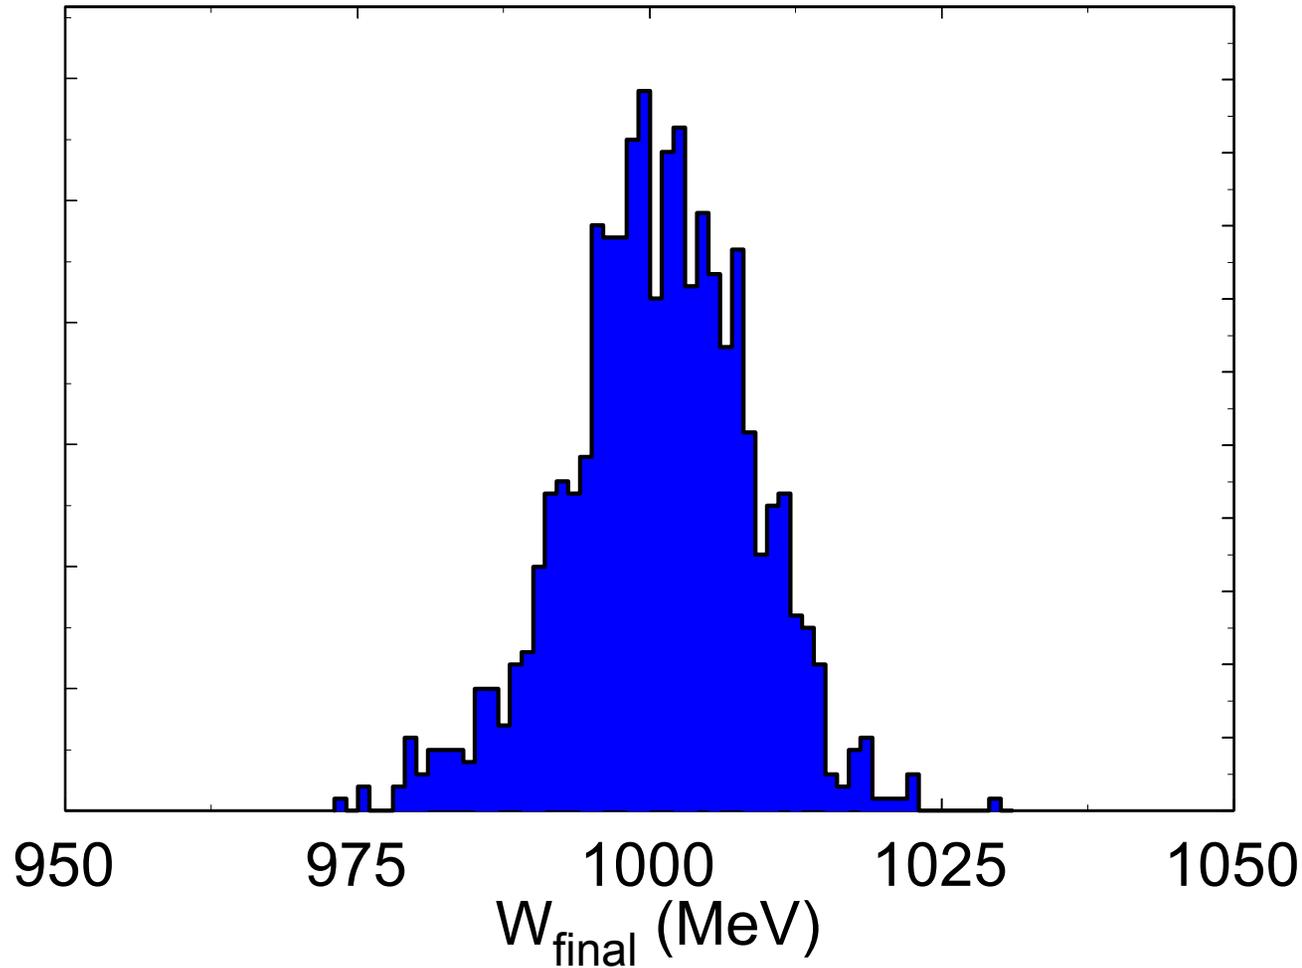

The Reference Design Assumes the Mean Value of the Predicted Cavity Fields

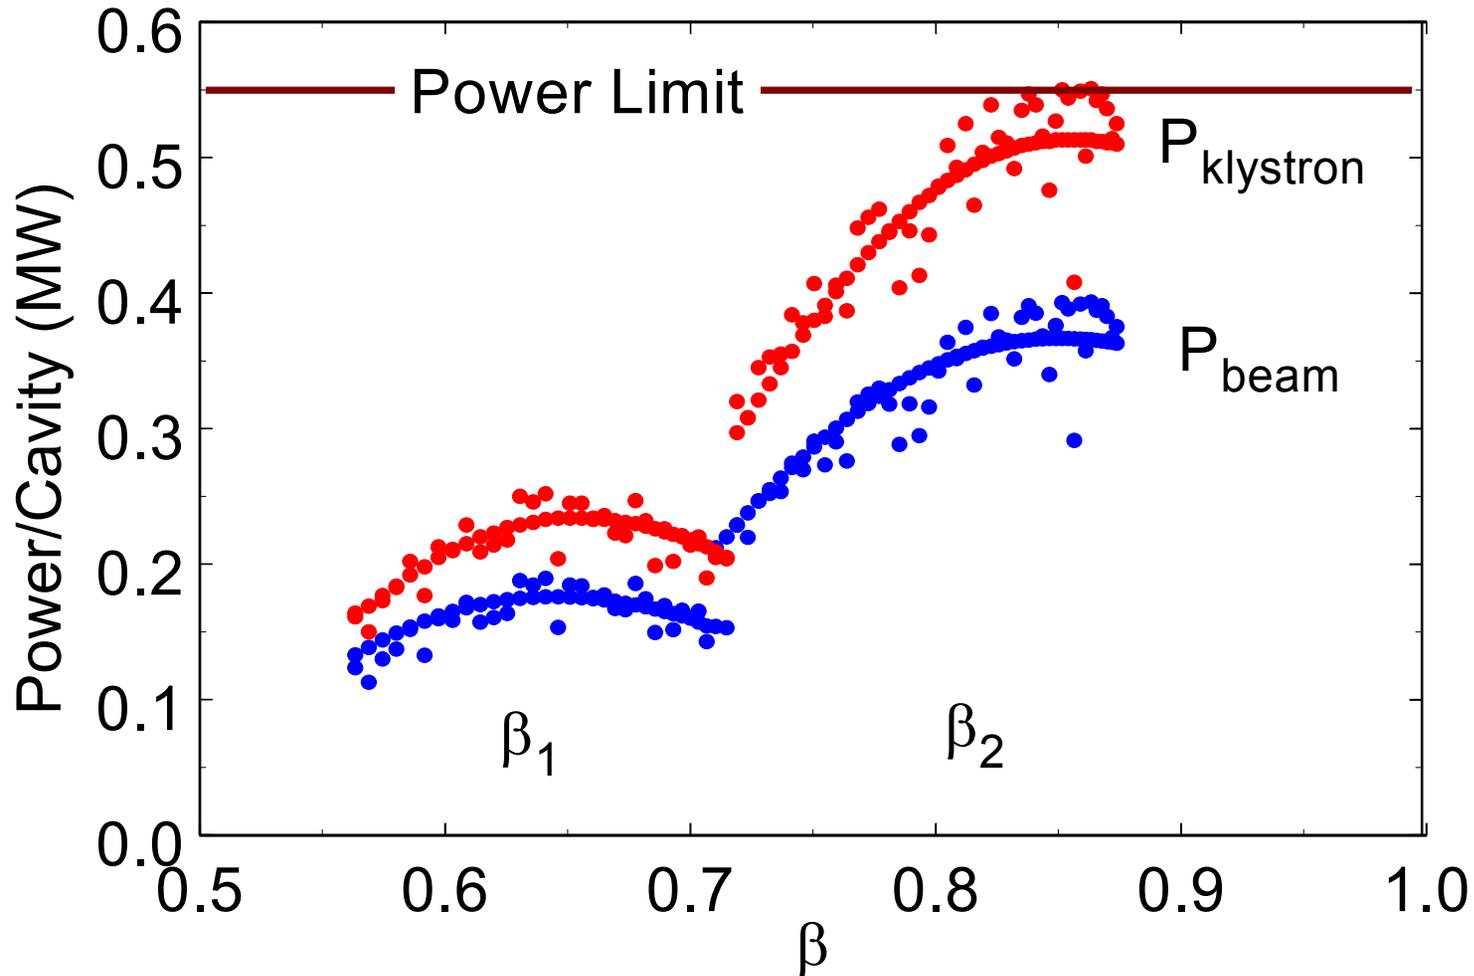

Phase Law Keeps $k_{0,l}$ Continuous but Reduces Longitudinal Acceptance

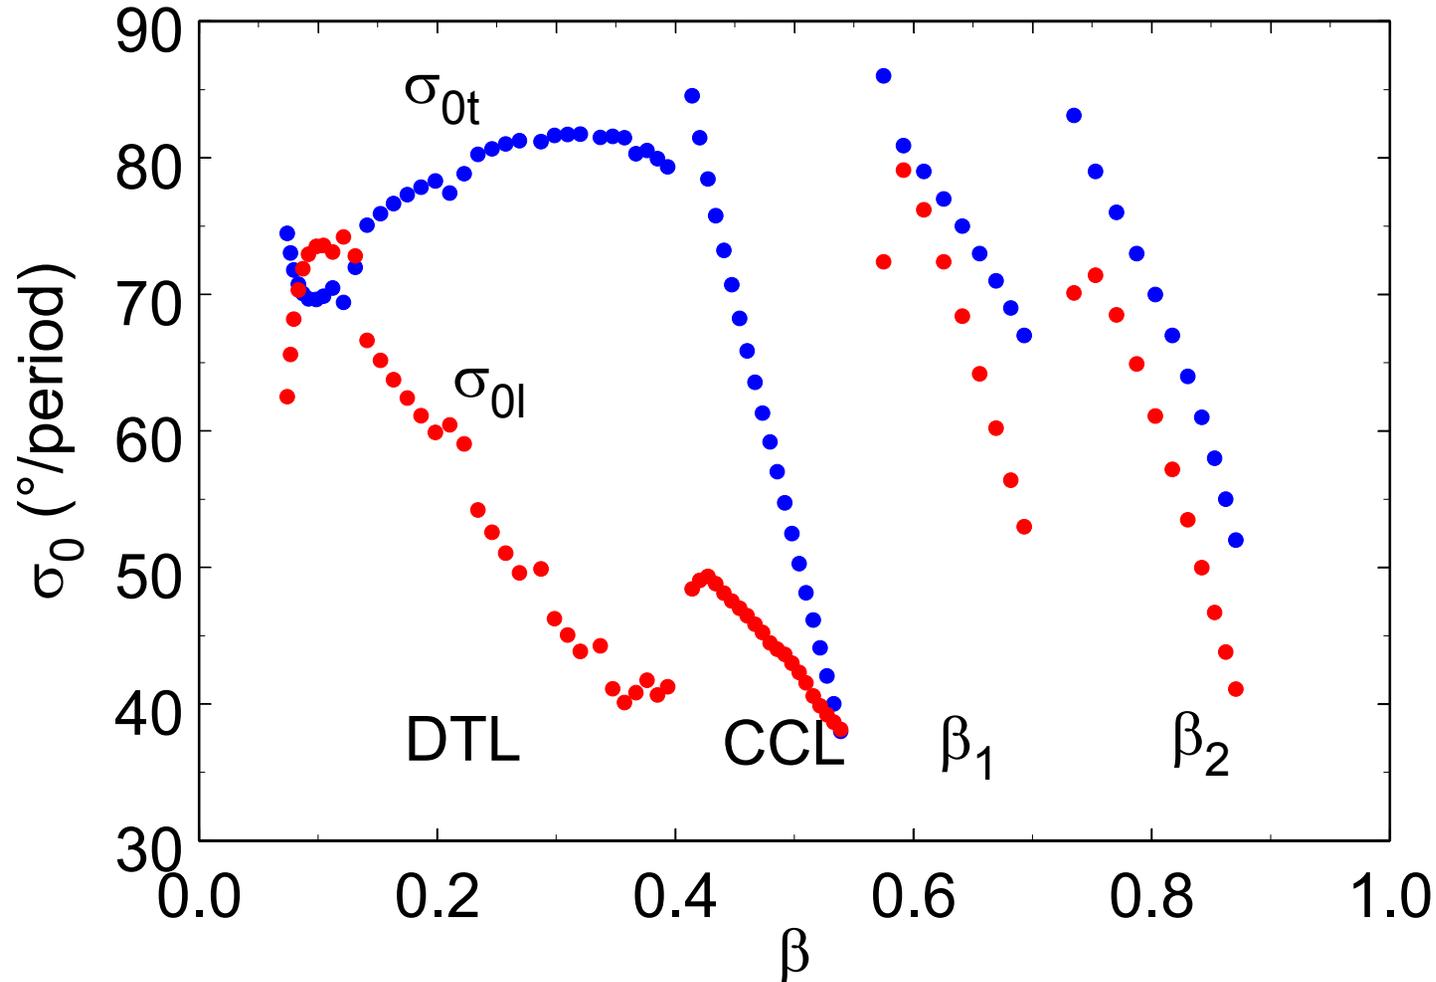

Expected $W_{\text{final}} = 1 \text{ GeV} \pm 15 \text{ MeV} (\pm 2\sigma)$

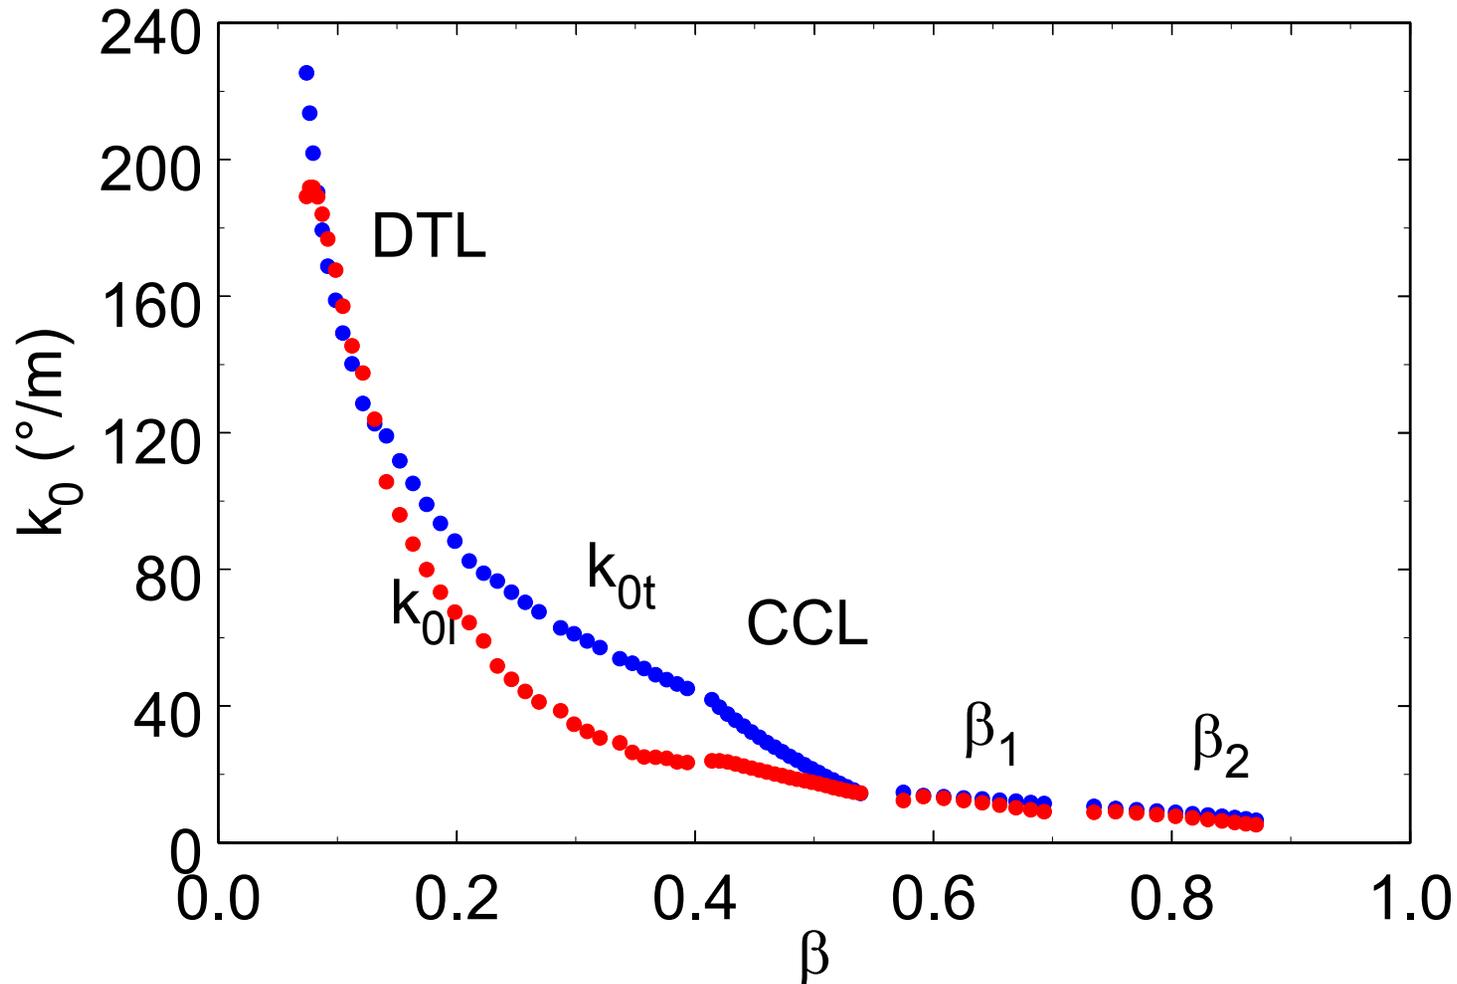

W_{final} is Limited by Cavity Quality, Beam Current is Limited by Klystron Power

Phase & Quad Laws Avoid Structure & Parametric Resonances Throughout

Continuous Real Estate Phase Advance Helps Current Independence

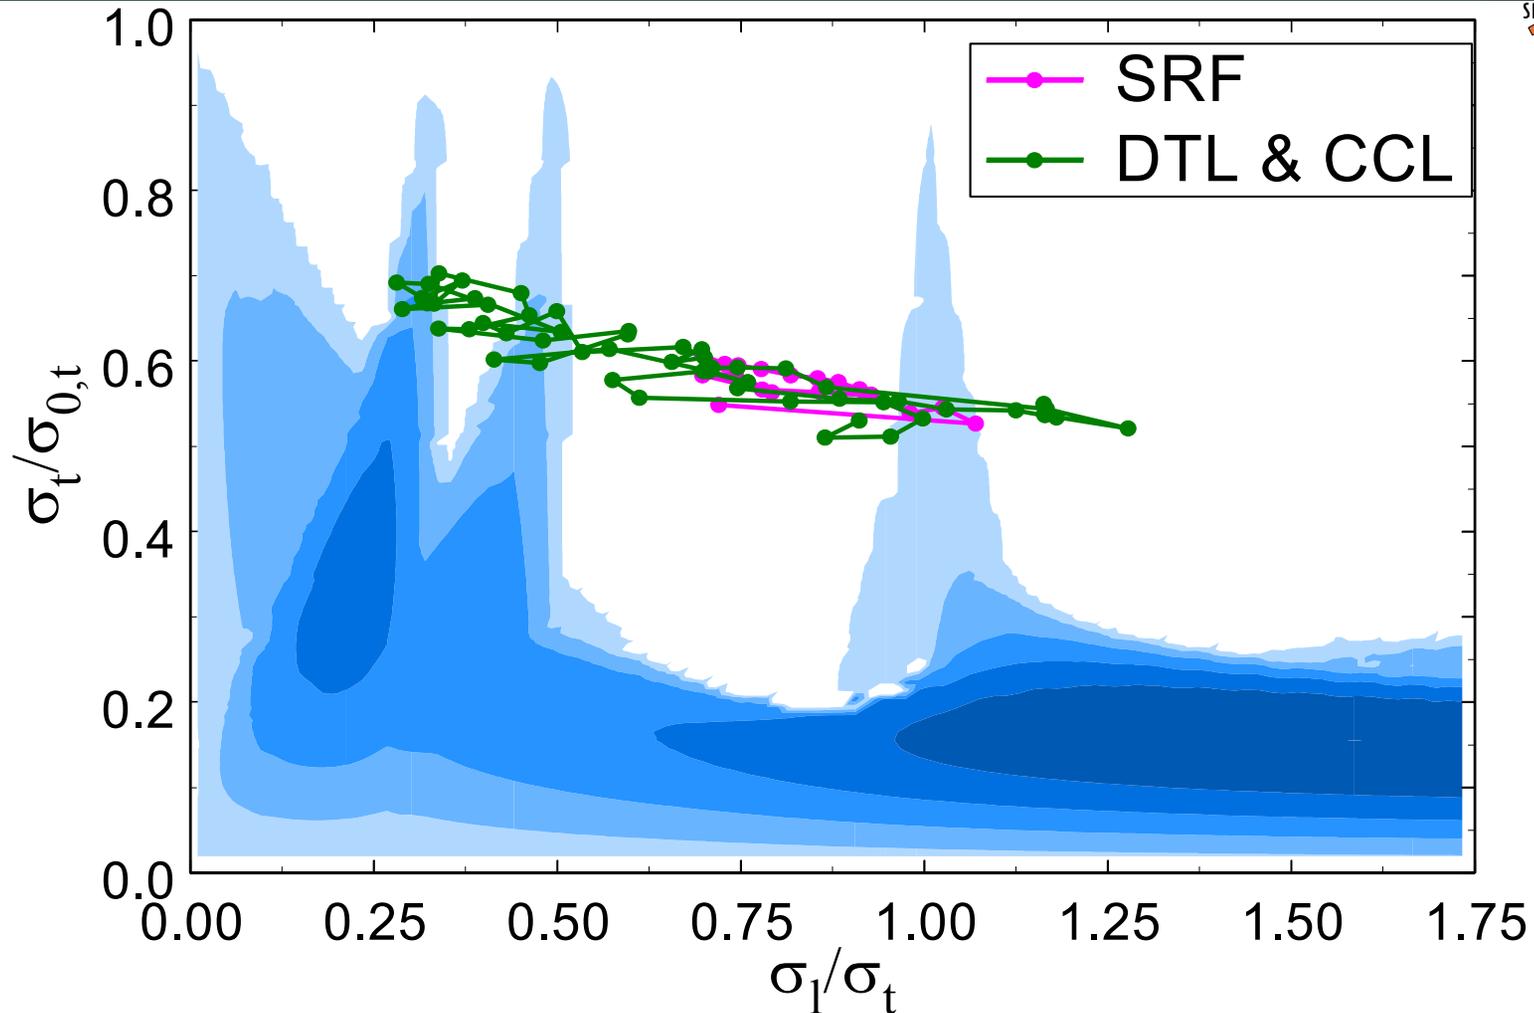

“Gone in 1.7 μ sec”

	DTL	CCL	SRF
Accel. Gaps	216	384	486
Lattice periods	37	24	23
Betatron Periods	8	4	4
Transit time (nsec)	552	387	733

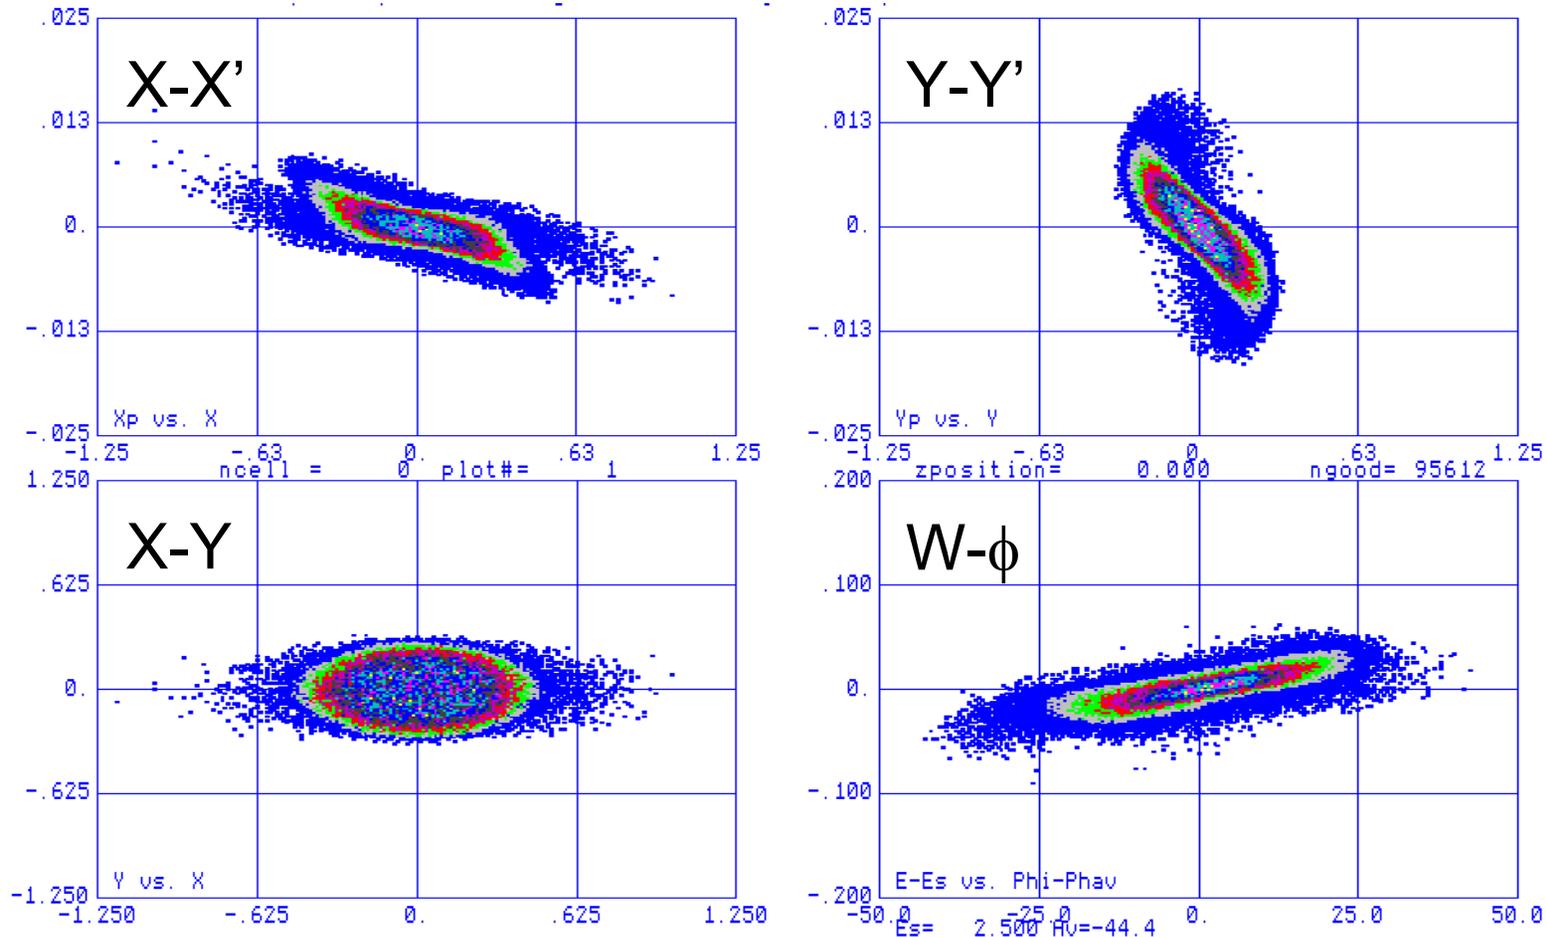

Coherent Resonances Pose Little Risk for Emittance Growth

Design Studies Assume a Water bag Distribution Entering the RFQ

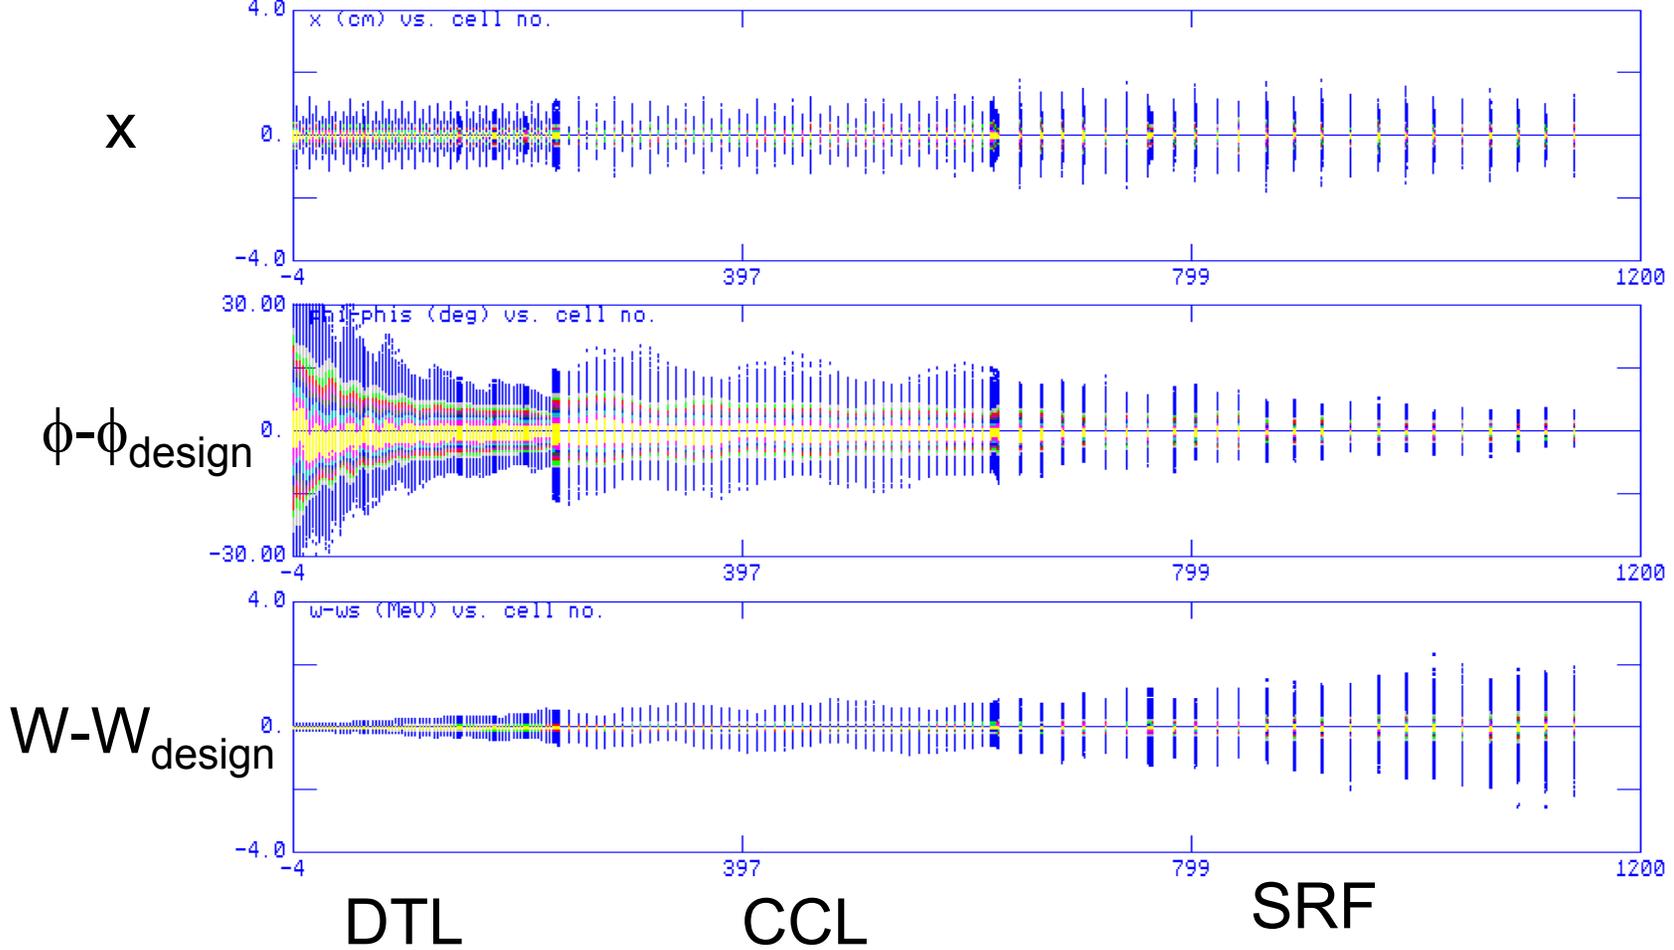

Beam Distribution at DTL Entrance

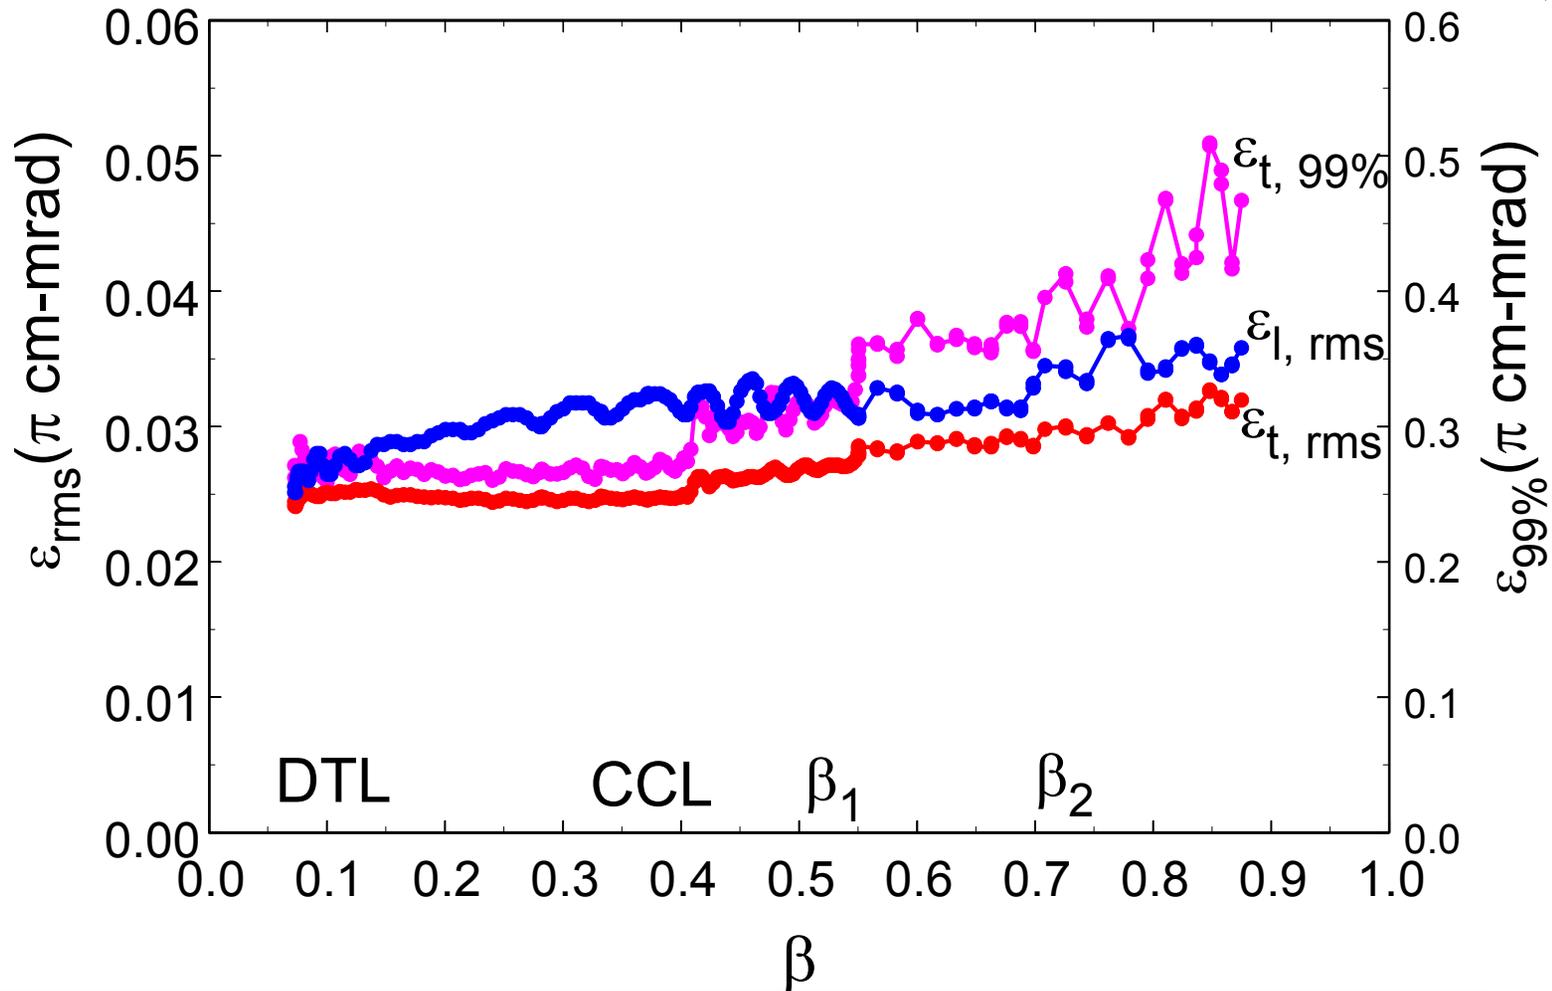

Profiles Show a Matched Beam

30% RMS Emittance Growth, Without Errors, Meets Design Spec.

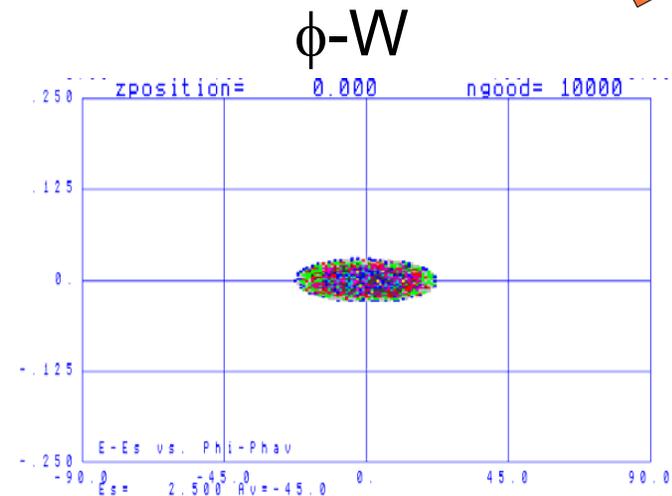

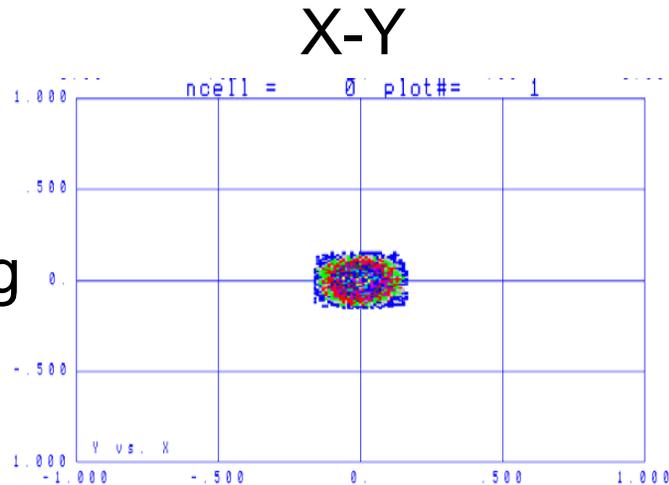

Beam Projections at 1 GeV Show Some Halo

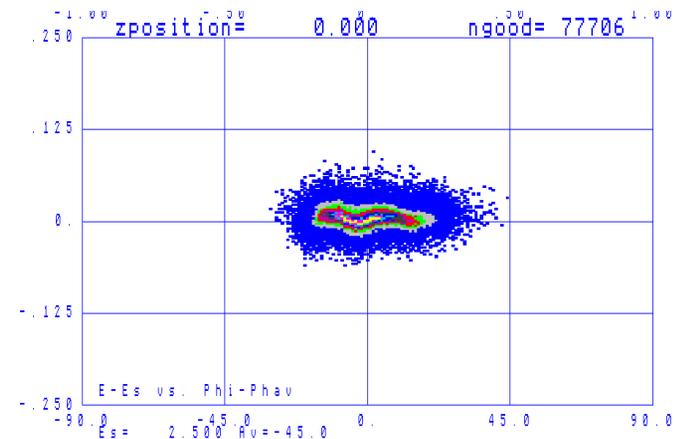

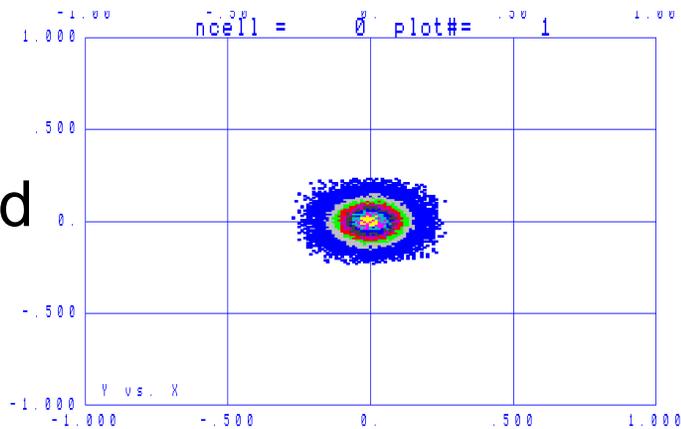

Beam Projections at RFQ Exit Show that Distributions are not Filtered by the RFQ

Water bag

Measured

Status of Linac Studies

- Specifications met for:
 - rms emittance
 - Spatial stability
 - Energy Stability
 - Energy spread
- Error studies are proceeding with “measured” beam distribution
 - Beam loss patterns
 - Distribution on the foil
- Tuning algorithms are under development
